

## Eton (Sweden)

The Eton Concept or the hanging system takes care of the non productive handling and the transportation in the sewing room, allowing operators more time for adding value. Eton makes this possible, thanks to the flexible chain positioning the products as close as 1cm from the needle point. Eton Concept believes productivity through Ergonomics.

The benefits are improved productivity increasing the sales value per employee, reduced throughput time allowing quick response to market demands, reduced work in process, improved quality control as any fault detected within hours of his occurrence due to the low WIP. More ever the garments while hanging throughout the manufacture – creasing and soiling does not occur. The absenteeism and labour fatigue is less at the ergonomically correct workplace.
